

VMHT

A camera based analog surveillance system for Haul Trucks

ViewMetrics for Haul Trucks (VMHT) is a new product of Motion Metrics International Corp. It is a camera based analog mirror pair which enhances the driver's field of view by displaying wide angle side views of the truck conveniently inside the cabin on high resolution LCD monitors. The wide angle camera views provide a greater visibility for the driver to prevent accidents and tire damage.

Product Features:

- Made of rugged and durable components for the harsh mining environment
- Cameras come with at least 5 years warranty, heater, and different view angles
- LCDs have both brightness and contrast control for different lighting conditions
- VMHT comes with all required components and is easy to install and maintain

This analog mirror system can work side by side with the conventional mirrors of the truck. The system can potentially reduce the downtime of the truck in a case the actual mirror of the truck is damaged or broken. VMHT consists of two rugged industrial cameras installed on either side of the truck and two 10.4" industrial-grade LCD monitors mounted inside the cab to display the mirrored side views inside the cabin, one on either side of the driver.
